

Averis x Monash Hackathon 2026 — Preliminary Round Judging Criteria

Use this page as a quick reference. The full rubric follows on the next page.

Scoring overview

100 points total: Technical 70 points • Product & Impact 30 points

The largest single criterion is Working Core Prototype at 25 points.

Criteria at a glance

Technical (70): System Design & Architecture 15 | Working Core Prototype 25 | Technology Integration 15 | Technical Feasibility & Validation 15

Product & Impact (30): Problem Statement Understanding 10 | Innovation & Solution Approach 10 | Practical Value & Potential 10

How to mark

- Score all seven criteria using whole numbers.
- Use the performance bands as guidance and score each criterion independently.
- Do not reward the same evidence twice.
- Base scores on what is demonstrated, submitted or clearly explained.

Category	Weak	Developing	Strong	Excellent
10-point criterion	0–2	3–5	6–7	8–10
15-point criterion	0–3	4–7	8–11	12–15
25-point criterion	0–6	7–12	13–18	19–25

TECHNICAL — 70 POINTS

No.	Criterion	Max	What judges assess	Weak	Developing	Strong	Excellent
1	System Design & Architecture	15	How well the solution is structured, including its main components, data flow, interfaces and dependencies.	Architecture is unclear or key components are missing.	A basic architecture is shown, but important links or decisions are unclear.	Architecture and data flow are clear, with sensible component choices.	Architecture is coherent, well justified and supported by the prototype or other technical evidence.
2	Working Core Prototype	25	How much of the core solution is working at the preliminary stage.	The core function does not work or is only shown through slides or mock-ups.	Part of the core works, but key steps rely on placeholders, manual workarounds or unstable connections.	The main flow works end-to-end with only minor gaps.	The core flow works reliably end-to-end and clearly shows that the main technical idea has been built.
3	Technology Integration	15	How appropriately and effectively the chosen technologies, tools, libraries, and APIs are integrated to solve the problem, with no restrictions on tech stack.	Technology choices are poorly justified or mismatched for the problem; integration is superficial, broken, or primarily cosmetic.	Technologies are functional within the project, but the integration is basic, relies heavily on boilerplate code, or shows limited technical depth.	Technologies are well-chosen and effectively integrated; components communicate cleanly and meaningfully contribute to the core solution.	Deep, seamless integration of modern or complex technologies; tools are leveraged to their full potential with strong technical craftsmanship.
4	Technical Feasibility & Validation	15	Whether key technical assumptions have been tested and the team has a realistic path to a complete solution.	Major technical risks are untested or ignored.	Some risks are tested, but important questions remain.	Key risks are tested and important limitations are understood.	Critical assumptions are validated with clear evidence and there is a credible path to completion.

PRODUCT & IMPACT — 30 POINTS

No.	Criterion	Max	What judges assess	Weak	Developing	Strong	Excellent
5	Problem Statement Understanding	10	How clearly the team understands the given problem statement, affected users or stakeholders, and the need being addressed.	Limited understanding of the problem or who it affects.	The problem is understood at a basic level, but context or needs are unclear.	Clear understanding of the problem and relevant users or stakeholders.	Strong, well-supported understanding of the problem, its context and why it matters.
6	Innovation & Solution Approach	10	How original and suitable the proposed solution is for the problem statement.	The idea is generic or poorly suited to the problem.	The approach is workable but familiar, with limited differentiation.	The approach is thoughtful, relevant and meaningfully differentiated.	The approach is original, well justified and offers a clear advantage.
7	Practical Value & Potential	10	Whether the solution could provide useful value and has a realistic path beyond the preliminary round.	Value is unclear or the idea is not realistically usable.	Some value is visible, but next steps or adoption potential are vague.	Clear practical value with realistic next steps.	Strong practical value with a credible path to wider use or impact.

Scoring note: use the performance bands as guidance and award a whole-number score within the relevant range. Score each criterion independently and avoid rewarding the same evidence twice.

Preliminary Round Judge Score Sheet

Enter one whole-number score per criterion. Use the rubric descriptions to guide the score.

Team: _____ Judge: _____

No.	Criterion	Max	Score	Judge Notes
1	System Design & Architecture	15		
2	Working Core Prototype	25		
3	Technology Integration	15		
4	Technical Feasibility & Validation	15		
5	Problem Statement Understanding	10		
6	Innovation & Solution Approach	10		
7	Practical Value & Potential	10		
TECHNICAL TOTAL		70
